A: I've had a bit of a hunt for a file manager that will do just that, and I've found WinHexer - it's a free open source hex editor for Windows. Here's a screenshot from the project home: (source: the-hexer.com) There's no installer or setup script, and the project is quite small - just 5.55 kb - so it's easily portable. As you can see, it can easily parse and manage binary data, and read/write to/from files. I'll go so far as to say it's probably the best file manager around for the job - it's really fast and reliable, and the features it's packing in are simply what you need. You can read a little about it here: I'd suggest trying it out, it'll give you a good idea of what it can do. Q: I need to compare all values in an array. But for some reason only the first value is compared? I have a database with images and each image has a caption. What I want to do is to create an array with the captions and then compare all of them. The problem is that my images are the string "1.jpg", "2.jpg", "3.jpg" so I need to compare "1" with "1", "1" with "2", "1" with "3" and so on. But it only compares "1" with "1" no matter how many times. This is the code I am using. I do not know what to change, because I only find answers on how to compare one value and not an array. `var images = new string[] { "1.jpg", "2.jpg", "3.jpg" }; string a = "1.jpg"; string b = "1.jpg"; string c = "1.jpg"; string d = "2.jpg"`

I wish there was a way to sort by a value or rename a subfolder, or even simply the ability to choose which attributes to add or remove. And, please include your email address or make a mailing list address available so I can be sure to contact you if there is a problem. Received a postcard from Roland with a picture of a Siesta on it. The inside of the card said, "Enjoy your week. Rhonda". If that wasn't enough, there is also a personal message from Nick Petrini on the back. Thanks for the greeting, Rhonda! You can find 94e9d1d2d9

Set Attributes of Files and Folders is a free tool that simplifies the task of changing file and folder attributes by processing the items in bulk. It's a rather straightforward utility that doesn't require experience with file management software. Portable tool with intuitive UI The program's wrapped in a single.exe file that can be dropped anywhere on the hard disk or a removable storage unit, in order to effortlessly run it on any PC. It doesn't make any changes to the Windows registry. However, it automatically creates an.ini file with configuration settings in the same location. As far as the interface is concerned, the application opts for a simple design and approachable options. You can begin by indicating a directory to include in the task, along with its subdirectories and files. Although it's not possible to exclude the root directory or its subfolders, you can filter files by name or extension. Set or remove file attributes In the following step, you can set the attributes by making any combination out of the archive, read-only, hidden and system labels. Worth noting is that it's also possible to strip off file attributes by leaving the checkboxes cleared. During the task, Set Attributes of Files and Folders shows log details, such as the start and stop time, duration, and full path of each processed file. The job can be aborted if it takes too long, or the program can be restarted. Evaluation and conclusion It features easy-to-understand options. Although it gives you the possibility to filter files by name or extension, it doesn't make room for other configuration preferences, such as excluding folders or subfolders.
